pr detection of polymorphic genetic markers of the form
pr (dd-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
Claim 1; Column 13-14; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences
CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC repeats, especially for use in e.g paternity or maternity testing,
CC human genetic analysis such as linkage analysis of genetic disease,
CC containing the repeat sequences were isolated by hybridisation of
CC containing the repeat sequences were isolated by hybridisation of
CC chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT)
CC probe. Over 100 repeat blocks were isolated. The inserts from the clones
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence is from the marker clone Mdf120 which contains the repeat
CC Sequence 50 BP; 20 A; 25 C; 0 G; 5 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PT Detection of polymorphic genetic markers of the form

PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols: as primers

Claim 1; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences

The invention relates to the isolation of polymorphic repeat sequences

CC markers. Primers based on these sequences can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC contains the sepecially for use in e.g paternity or maternity testing,

CC commercial animal or plant breeding or peddyree analysis clones

CC containing the repeat sequences were isolated by hybridisation of

CC probe. Over 100 repeat blocks were isolated by hybridisation of

CC probe. Over 100 repeat blocks were isolated The inserts from the clones

CC were amplified by primers T65798-T66047. Those clones where the repeat

CC sequence has been determined are shown in T65704-797. This repeat

CC sequence is from the marker clone Mdf5 which contains the repeat

CC sequence 56 BP; 23 A; 28 C; 0 G; 5 T;

                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                           PT gene mapping, and selective breeding

PS Table 7; Page 170; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross-hybridised. Assuming independent

CC distribution of microsatellites and MboI sites; the frequency of

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC 000. The sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence

CC were used to generate the required PCR primers for in vitro

CC amplification of the corresp. microsatellite using the program

CC opTIPRIM). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC loci, or genes involved the determinism of economically important

CC traits esp. in cattle, to allow selective breeding.

gene mapping, and selective breeding

Table 7; Page 167; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine MboI DNA fragments of between

250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

One out of 50 clones cross-hybridised. Assuming independent

distribution of microsatellites and MboI sites, the frequency of

(T6)n >9 microsatellites in the bovine genome is estimated at >100,

000. The sequence information for ca. 230 such bovine microsatellites

is summarised in the specification and indexed herein (see below).

Stream seed to generate the required PCR primers for in vitro

amplification of the corresp. microsatellite (using the program

OPTIPRIM). The microsatellites may be used to dentify individuals,

for parentage and in the broader manning of economic testify

optimized the required pCR primers for in vitro

amplification of the corresp. microsatellite (using the program

optimized program of the microsatellites may be used to identify individuals,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pri gene mapping, and selective breeding

Pri gene mapping, and selective breeding

Rough Table 7; Page 176; 517pp; English.

Come out of a library of bovine microsatellite sequence obtd. by

Come out of 50 clones cross hybridised. Assuming independent

Come out of 50 clones cross hybridised. Assuming independent

Come out of 50 clones cross hybridised. Assuming independent

Come out of 50 clones cross hybridised. Assuming independent

Come out of 50 clones cross hybridised. Assuming independent

Compared to the sequence information for ca. 20 such bovine microsatellites

Compared to generate the specification and indexed herein (see below).

Come used to generate the required pcr primers for in vitro

complification of the corresp. microsatellites may be used to identify individuals,

PT Polymorphic bowine DNA markers - used in genetic identification, proper gene mapping, and selective breeding fable 7; Page 14; 517pp; English.

CC The sequence is that of a bowine microsatellite sequence obtd. by cc screening a library of bowine MboI DNA fragments of between CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. CC One out of 50 clones cross-hybridised. Assuming independent CC (15)n >9 microsatellites and MboI sites, the frequency of CC (T6)n >9 microsatellites in the bowine genome is estimated at >100, CC (00). The sequence information for ca. 230 such bowine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program CC opTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait CC traits esp. in cattle, to allow selective breeding.

It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Example 1: Page 45; 117pp; English.

Camplification of the Alu repeat sequence, which is used in the camplification of the Alu repeat sequence, which is used to comprise the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of the sequence of DNA is known. Using the vector(s) into E. coli cells. Campled to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

                                                                                                                             Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telomere and nucleic acid for recombination Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

GENEAUT: Orr, Harry 1.

APPLICANT: Ranum, Laura P.W.
APPLICANT: Chung, Ming-yi
APPLICANT: 20ghbi, Huda Y.
TITLE OF INVENTION: Gene Sequence for Spinocerebellar Ataxia
PATENT NO. 5741645
FATHLE OF INVENTION: Type 1 and Method for Diagnosis
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:
ADDRESSEE: Mueting, Raasch, Gebhardt & Schwappach, P.A.
STREET: 119 NO. 5741645th Fourth Street, Suite 203
                                                                       Sequence 45, Application US/08267803B
Patent No. 5834183
GENERAL INFORMATION:
APPLICANT: OTI, Harry T.
APPLICANT: Ranum, Laura P. M.
APPLICANT: Cohung, Ming-yi
APPLICANT: Zoghbi, Huda Y.
TITLE OF INVENTION: Gene Sequence for the sequence of the sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 11

Double-stranded cDNAs were synthesized from the mRNA using an oligo(dT) NotI primer. After shearing to 200-400 bp, a synthetic linker-primer, which has one blunt and one sticky end and internal EcoRI site, was ligated to the cDNAs. The cDNAs were amplified by the polymerase chain reaction (PCR) using the ligated linker-primer sequence. After denaturation and reassociation of the ds-cDNAs, and isolation of single-stranded cDNAs were again amplified by PCR. The cDNAs were digested with EcoRI and NotI, and inserted into a plasmid vector.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. " a 34 c 21 g 22 t

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Example 8; Column 57-58; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis.

The repeats, when analysed, fall into 4 categories:

1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence;

2) imperfect repeats which are defined as 2 or more runs of uninterrupted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
PT Detection of polymorphic genetic markers of the form
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
ps Claim 1; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences
CC thaving the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC commarkers. Primers based on these sequences can be used to detect these
CC containing the repeat sequences analysis of genetic disease,
CC containing the repeat sequences were isolated by hybridisation of
CC containing the repeat sequences were isolated by hybridisation of
CC containing the repeat blocks were isolated. The inserts from the clones
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence is from the marker clone Mdf5 which contains the repeat
CC sequence is from the marker clone Mdf5 which contains the repeat
CC sequence having the formula: (CT)7(CA)23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pr Detection of polymorphic genetic markers of the form
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
Claim 1; Column 13-14; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences
The invention relates to the isolation of polymorphic repeat sequences
Chaving the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
C markers. Primers based on these sequences can be used to detect these
C repeats, especially for use in e.g paternity or maternity testing,
C human genetic analysis such as linkage analysis of genetic disease,
C commercial animal or plant breeding or pedigree analysis. Clones
C containing the repeat sequences were isolated by hybridisation of
C chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT)
probe. Over 100 repeat blocks were isolated. The inserts from the clones
were amplified by primers 765798-766047. Those clones where the repeat
C sequence has been determined are shown in 765704-797. This repeat
C sequence is from the marker clone Mdf120 which contains the repeat
C sequence 1s from the formula: (TC)5(AC)20.

gene mapping, and selective breeding
Table 7; Page 170; 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
one out of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and MboI sites, the frequency of
(T6)n >9 microsatellites in the bovine genome is estimated at >100,
000. The sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
were used to generate the required PCR primers for in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-APR-1989; 341562.

CC The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between

CC One out of 50 clones cross-hybridised. Assuming independent

CC distribution of microsatellites and MboI sites, the frequency of

CC (76)n >9 microsatellites in the bovine genome is estimated at >100,

CC (76)n >9 microsatellites in the bovine genome is estimated at >100,

CC on the sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

CC the sequences upstream and downstream of the microsatellites sequence

CC were used to generate the required PCR primers for in vitro

amplification of the corresp. microsatellite (using the program

CC ompirky). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC conjectures of in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             program appling, and selective breeding

Table 7; Page 176; 517pp; English.

Table 7; Page 176; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by

CC The sequence is that of a bovine microsatellite sequence obtd. by

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC one out of 50 clones cross-hybridised. Assuming independent

CC (15)n >9 microsatellites in the bovine genome is estimated at >100,

CC (000. The sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence

were used to generate the required PCR primers for in vitro

compilfication of the corresp. microsatellite (using the program complification). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait

CC traits esp. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PT Polymorphic bowlne DNA markers - used in genetic identification, properly properly and selective breeding Table 7; Page 167; 517pp; English.

CC The sequence is that of a bowlne microsatellite sequence obtd. by cc screening a library of bowlne mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. CC one out of 50 clones cross-hybridised. Assuming independent cd stribution of microsatellites and Mbol Sites, the frequency of CC (T6)n >9 microsatellites in the bowlne genome is estimated at >100, CC is summarised in the specification for ca. 230 such bowlne microsatellites completed to generate the required PCR primers for in vitro amplification of the corresp. microsatellite sequence complification of the corresp. microsatellite (using the program complification of in cattle, and in the genetic mapping of economic trait consists esp. in cattle, to allow selective breeding.

Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be present and an area of the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            See also

Example 2: Page 42: 82pp; English.
Competition experiments using the DNAseI protection assay showed
that an oligonucleotide conty. 15 tandem ATT repeats was an
effective competitor for binding of the HeLa factor. This oligo was
used to prepare an oligonucleotide affinity column for purification
of RIP60 from Chinese hamster cells. The protein recognises and
binds to an (ATT)n motif in the dhfr gene ori. It can also bind to
the yeast ARS1 domain B. See Q22753 and Q24811.

The STR can be used for treatment and diagnosis in and veterinary medicine, partic. for genetic characterisation mapping, linkage studies and analysis/diagnosis of acquired dalleles.

New biocompatible medical devices and articles - using a lactic pri acid-glycolic acid polyester in which monomer units are rindividually and specifically determined by the principle of the specifically determined by the page 45; 67pp; English.

CC Encode polyesters given in 071801-02. This fragment was ligated into the Klenow blunted sequences given in 071808-09 which represent the 3' and 5' ends of the plasmid psport ib digested with Foki. This places this synthetic fragment under the control of the E. coli trpA initiator sequence was used to express the sequences given in 071801-02 in an E. coli cell free medium. The expressed complete the control of the polyesters derived from the a-maino acid analogues of an amino acid except pro. Of the three stop codons, URA, URA and UGA, one of these constrol trpA three stop codons, URA, URA and UGA, one of these codon, therefore the first lactate and glycolate are encoded by URA and URA codon. This is accomplished through the use of a specially modified complete the first lactate of the chain may be encoded by an CC encept modified to carry lactate instead of Met. Alternatively, a cresulting polymer is treated with cyanogen bromide to remove the Met. CC opon the first position of the polymer chain. The cresulting polymer is treated with cyanogen bromide to remove the Met. CC opon the sproduce in this manner may be used to produce sutures, cc staples, clips, drug delivery devices, pins and screws.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        synthetic polyester genes given in Q71801-02. These fragments were used in the production of the full length polyester gene in the plasmid pMAL-p2. This plasmid was used so that the polyester could be expressed in an E. coli cell free meddum, as pMAL-p2 is recognised by E. coli cribozymes and contains the necessary initiator sequences and the complate for the polypeptide leader. The resulting plasmid pMAL-2c contains the complete polyester coding sequence ligated in frame with the leader sequence. The expressed sequences represent synthetic genes which were used in the synthesis of polyesters derived from the codons, UAA, UAG and UGA, one of these stop codons is reversed for the stop signal for the polyester. The remaining two stop codons are available for encoding the monomer units of the polyester. Lactate and allycolate are encoded by UAA and UAG, respectively. Initiation of the chain may be encoded by an AUG codon, therefore the first lactate of the chain may be encoded by an AUG codon. This is accomplished through the use of a specially modified Met-tRNAf modified to carry lactate instead of Met. Alternatively, a Met is incorporated in the cfirst position of the polymer chain. The resulting polymer is treated with cyanogen bromide to remove the Met. Co-polymers produced in this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Example 1; Page 45; 67pp; English.

This sequence represents a fragment of the plasmid psporT Ic which contains the 5' fragment of the synthetic genes which encode polyesters, given in Q71801-02, under the control of the E. coli trpA transcription initiator and followed by FokI and HindIII restriction sites. A further fragment of the synthetic genes were ligated into psporT Ic to give plasmid psporT Id (see also Q71810-11), with the final fragment being inserted in a third round of ligation to give psporT Ie (see also Q71812).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 first position of the polymer chain. The resulting powith cyanogen bromide to remove the Met. Co-polymers manner may be used to produce sutures, staples, clips, devices, pins and screws.

```
cc 13). The E. coli trpA initiator sequence was used to express the full cc length sequences given in Q71801-02 in an E. coli cell free medium. The expressed sequences represent synthetic genes which were used in the coli of polyesters derived from the a-maino acid analogues of an cc amino acid except pro. Of the three stop codons, UAA, UAG and UGA, one of these stop codons is reversed for the stop signal for the polyester. Cc units of the polyester. Lactate and glycolate are encoded by UAA and CC UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an CC Met. TRNAf modified to carry lactate instead of Met. alternatively, a met is incorporated in the first position of the polymer chain. The cc resulting polymer is treated with cyanogen bromide to remove the Met. Cc Co-polymers produced in this manner may be used to produce sutures, sequence 103 BP; 58 A; 7 C; 9 G; 29 T;
